Chapitre I

General guidelines

Here are some key points to consider :

- Your project can encompass any topic.
- You're required to draft comprehensive specifications covering all aspects of your project, including but not limited to project presentation and goals, used technologies, expected features, operational needs,
- Depending on the selected topic, you may need to consider legal aspects and constraints that apply on your project. Make them clearly appear in your specifications and do not neglect them.
- These specifications should span a timeframe equivalent to 6 months of part-time work.
- Aim for a balanced scope, ensuring the workload is neither overwhelming nor too sparse.
- Throughout the project implementation phase, you will strive to adhere closely to the initial specifications. Aim for a realistic target.
- Evaluation criteria include not only the final outcome but also group cohesion, equitable workload distribution, and meeting expectations. This first step is already a warmup regarding your group work, and may raise warnings and problems that need to be solved quickly.
